

Dark Web + O365 & G Suite Monitoring

Inevitably, the switch to a complete remote working model in such a short space of time brings with it a myriad of security challenges, particularly with many employees using personal devices to exchange and share data while using office 365 and G Suite solutions that were never designed to stop breaches on the dark deep web or commonly referred to as the “black market web”

Dark Web Threats are known to:

- Share exploits Data breach, including O365 credentials.
- Cybercriminals steal or buy credentials in third-party breaches and reuse them to access corporate systems.
- They could commit cyber-fraud such as business email compromise (BEC) attacks in which cybercriminals hijack business email accounts to facilitate fraudulent wire transfers.
